

# Open-Source CFD simulation package

## «OpenHyperFLOW2D»

(User guide)

Version 2.01

(<http://github.com/sergeas67/openhyperflow2d>)

### General description of CFD simulation package

**OpenHyperFLOW2D** it is open-source research-educational code for CFD simulation 2D (flat/axisymmetric) transient, viscous, compressible, multi-components sub/trans/supersonic reacting gas flows.

Solver and pre-processor written in C++ and have the following features:

- Using finite difference method (FDM);
- Use a regular orthogonal (rectangular) Cartesian grid;
- For solution used time-depended method with explicit blended marching finite-difference scheme, second-order central differences in the spatial and first order in time Explicit Euler Method (Forward Euler)
- To capture discontinuities use locally adapted non-linear blending factor function (BFF). The solution is found as linear combination of solutions obtained in the scheme with central differences (high-order scheme with low numerical dissipation) and the Lax-Friedrichs (low-order scheme with a high numerical dissipation)

$$\mathbf{F}_{\text{sol}} = \mathbf{BFF} * \mathbf{F}_{\text{cds}} + (1 - \mathbf{BFF}) * \mathbf{F}_{\text{LxF}}$$

where,

$\mathbf{F}_{\text{sol}}$  — general solution obtained as a linear combination of solutions to the scheme with low numerical dissipation and solutions to the scheme with high numerical dissipation.

$\mathbf{F}_{\text{cds}}$  — the solution obtained on central differences scheme (CDS).

$\mathbf{F}_{\text{LxF}}$  — solution obtained by Lax-Friedrichs scheme (LxF).

$\mathbf{BFF}$  — non-linear blending factor function, depending on local parameters.

- Non-orthogonality of boundaries taken into account through the slope-matrix at the boundary nodes of the grid (Immersed Boundary Method analogue);
- The ability to set the boundary conditions I, II and III-type for any of the dependent variables, assignments mixed boundary conditions;
- Temperature dependence of the physical properties of the gas mixture components;
- Can use various RANS/URANS turbulence models
  - Zero-equation models:
    - *Prandtl*;
    - *van Driest*;
    - *Escudier*;
    - *Klebanoff*;
    - *Smagorinsky-Lilly*;
  - One-equation models:
    - *Spalart-Allmaras* model;
  - Two-equations models:
    - Standard (*Spalding*)  $k$ - $\epsilon$  model;
    - *Chien*  $k$ - $\epsilon$  model;
    - *Jones-Launder*  $k$ - $\epsilon$  model;
    - *Launder and Sharma*, with *Yap*-correction  $k$ - $\epsilon$  model;
    - RNG  $k$ - $\epsilon$  model;
- Ability to calculate multi-components reacting flows;
- Parallel versions of solvers with automatic spatial domain decomposition with support OpenMP for shared memory systems and with support of MPI (Message Passing Interface) for HPC-clusters (Intel MPI, MVAPICH, OpenMPI, HP MPI). Also available parallel version of solver with support GPU (NVidia *CUDA*);
- Saving the results of calculation in ASCII format of [Tecplot](#) post-processor;
- Saving solver state on checkpoints with the possibility the restart of calculating;

## Representation of the input data

To store input data for pre-processors and solvers use an **object** representation. Object is identified by its name and type. In the current version of the program (2.01) uses 3 types of storage objects:

1. Storage
2. A single data object
3. Table

Storage - **container** that can contain objects of type data and table

One input file contains a single storage. The syntax of this object in the input data file:

<start/[storage name]>

...

<end/[storage name]>

A single data object — contains a single text (string), integer (int), or real (float) value.

The syntax of this object in the source data file:

<data/[name]=[value]>

Example:

<data/A=1> - object data named «A» have **integer** value 1

<data/B=2.56> - object data named «B» have **real** value 2.56

<data/C=Test> - object data named «C» have **text** value «Test»

These all objects of type data is stored in plain text and if possible, can be converted by reading if such a transformation is correct.

For example <data/A=1> can be read as a text "1" as the integer 1, and as a real 1.0, <data/B=2.56>, as the text "2.56" and as real 2.56, while trying to read the value of this object as an integer will get a message about an incorrect data type.

Table - contains several coupled pairs of real numbers. Used to set the tabulated functions with one argument.

The syntax of this object in the input data file:

```
<table=[name]/[number coupled pair values (int)]>
```

```
[function argument(float)] [function value(float)]
```

...

```
<endtable>
```

Example:

```
<table=D/5>
```

```
0.0    2.0
```

```
1.0    4.0
```

```
2.0    5.0
```

```
3.0    5.5
```

```
4.0    6.0
```

```
<endtable>
```

The values in the pair may be separated by spaces or tabs, the number of pairs must match the number in the table header. The first column of the table corresponds to the function's arguments, the second, value of the function:  $D(0.) = 2$ . The argument can be any value, while if the argument falls within the range between the two adjacent values, the result is a linear approximation of the value of the function, such as  $D(0.5) = 3$ . If the argument is outside the upper and lower bounds of arguments defined in the table, value of the function takes an extreme value in the table, such as  $D(-1.) = 2.0$ ,  $D(100) = 6.0$

Any entries in the initial data do not correspond to the syntax will be ignored, lines that contain the symbols of comments “;” and “#” are also ignored from the comment symbol position to the end of the line.

## Description of input data for «OpenHyperFLOW2D» solver

OpenHyperFLOW2D solver uses a single input file with one repository (except airfoil cases). In the [Table 1](#) lists the required that must contain raw data file (for version 2.01 solver, other versions of the solver can have a different set of required objects.) If the source data file is not at least one of the required parameters, or its value is not a valid type/syntax, solver initialization will be interrupted with a corresponding error message. Parameters, highlighted by **gray** color is experimental and for this need additional tests.

OpenHyperFLOW2D solver has 4 versions:

1. Serial solver: used on systems with one processor. Currently, this version is used only for debugging.
2. Parallel solver for systems with shared memory: used on multi-core / multi-processor systems with support OpenMP.
3. Parallel solver for systems with distributed memory: used on computer clusters and multi-core/multi-processor workstation with support MPI libraries and is now the main version.
4. Parallel solver for systems with GPUs: used on computers with NVidia GPU (like NVidia K80,K40,K20,Quadro,GTX Titan, etc) with *CUDA* support (multi-GPU also). This version of OpenHyperFLOW2D solver is experimental.

Input data file compatible with all versions of the solvers. Specific parameters for different version of solver just ignored in others. All versions of the solver is running on GNU/Linux x86\_64.

For viewing and post-processing the results of the calculation in the form of 2D distributions of the parameters it is recommended to use a professional post-processor [Tecplot](#), which is considered the “de facto” standard in the CFD.

Table 1

| No | Object type | Object name             | Value type | Description   |
|----|-------------|-------------------------|------------|---|
| 1  | storage     | <arbitrary>             | string     | It identifies the <u>name of the data storage</u>   |
| 2  | data        | <b>ProjectName</b>      | string     | It identifies the <u>name of the project</u> . All files created when using the solver will include this name                           |
| 3  | data        | <b>OutputFile</b>       | string     | Contains output file extension (usually '.plt'). This name is combined with the name of the project to specify the file name of results |
| 4  | data        | <b>ErrorFile</b>        | string     | suffix + results file extension for error diagnostics (usually '-err.plt')  |
| 5  | data        | <b>GasSwapFile</b>      | string     | Extension of swap file, with contents computational area (mesh) for gas (usually '.hf2d')   |
| 6  | data        | <b>OutVariablesList</b> | string     | List of variables for output (see available variables list in <a href="#">Table 2</a> )   |
| 7  | data        | <b>isSingleGPU</b>      | int        | Use only single GPU in multi-GPU systems ( <b>only for CUDA version</b> )<br>0 – No<br>1 – Yes  |
| 8  | data        | <b>ActiveSingleGPU</b>  | int        | Index of active GPU in single GPU mode ( <b>only for CUDA version</b> )   |
| 9  | data        | <b>isAdiabaticWall</b>  | int        | The model used to calculate the heat transfer on wall:<br>0 – isothermal<br>1 – adiabatic (thermally insulated)                         |
| 10 | data        | <b>FlowType</b>         | int        | Type of problem (2D formulation)<br>0 – flat<br>1 – axisymmetric  |
| 11 | data        | <b>ProblemType</b>      | int        | Type of problem (model)<br>0 – Euler (invisc.)<br>1 – Navier-Stokes (visc.)   |
| 12 | data        | <b>MaxX</b>             | int        | The dimension of the grid along the X axis  |
| 13 | data        | <b>MaxY</b>             | int        | The dimension of the grid along the Y axis  |
| 14 | data        | <b>dx</b>               | float      | The size of the grid cell along the axis X (m)  |
| 15 | data        | <b>dy</b>               | float      | The size of the grid cell along the axis Y (m)  |

Table 1

| No | Object type | Object name                | Value type | Description  |
|----|-------------|----------------------------|------------|--|
| 16 | data        | <b>MonitorIndex</b>        | int        | Index of monitor, which used for check task convergence:<br>0 - max residual<br>1 - $\rho$ residual<br>2 - $\rho U$ residual<br>3 - $\rho V$ residual<br>4 - $\rho E$ residual<br>5 - Time   |
| 17 | data        | <b>ExitMonitorValue</b>    | float      | Calculation is stop If exceed value of monitor   |
| 18 | data        | <b>isAlternateRMS</b>      | int        | Use an alternate algorithm for computing RMS residuals (L2-norm)   |
| 19 | data        | <b>CFL</b>                 | float      | The maximum of Courant-Friedrichs-Levy number (CFL) usually not more than 0.1-0.15   |
| 20 | table       | <b>CFL_Scenario</b>        |            | The scenario changes of CFL number, depending on the of iteration  |
| 21 | data        | <b>beta</b>                | float      | The base value of the blending factor (proportion by weight of the solution obtained in the CD scheme in the general solution in the steady state) is generally 0.985..0.99. When instability take place, this value can be reduced. |
| 22 | table       | <b>beta_Scenario</b>       |            | The scenario changes base blending factor (BBF), depending on the of iteration   |
| 23 | data        | <b>beta_NonReflectedBC</b> | float      | The base value of the blending factor in nodes with non-reflected BC (is generally <0.5)   |
| 24 | data        | <b>Nmax</b>                | int        | The number of iterations after which the intermediate results is saved in the file containing the binary image of the computational domain   |
| 25 | data        | <b>NOutStep</b>            | int        | The number of iterations after which occurs current iteration number, the RMS residuals, current calculation speed (iterations / sec) and the current time step  |
| 26 | data        | <b>NSaveStep</b>           | int        | NoutStep*Nmax - The number of iterations after which the intermediate results is saved in the results file in Tecplot format (ASCII version)   |

Table 1

| No | Object type | Object name              | Value type | Description   |
|----|-------------|--------------------------|------------|---|
| 27 | data        | <b>isVerboseOutput</b>   | int        | 1 – output data described in pp. 15 Tab.1<br>0 - no data output   |
| 28 | data        | <b>BFF</b>               | int        | Blending Factor Function (BFF). Type of function, which is calculated by a local blending factor, in this version of the program available indexes from 0 to 5 (recommended values: 4 for transient problems, 5 for steady state problems). |
| 29 | data        | <b>TurbulenceModel</b>   | int        | The type of turbulence model <sup>1</sup>   |
| 30 | data        | <b>isTurbulenceReset</b> | int        | 1 - reinitialize turbulence model (if there was a new set)<br>0 - use a turbulence model, stored in the binary image of the computational domain  |
| 31 | data        | <b>SigW</b>              | float      | Factor for adjustment total (molecular+turbulent) viscosity in the parietal cells<br>$\mu_{\text{new}} = \text{SigW} * \mu_{\text{old}}$  |
| 32 | data        | <b>SigF</b>              | float      | Factor for adjustment total (molecular+turbulent) viscosity in the core stream<br>$\mu_{\text{new}} = \text{SigF} * \mu_{\text{old}}$   |
| 33 | data        | <b>delta_bl</b>          | float      | The estimated thickness of the boundary layer (m), is used in some models of turbulence   |
| 34 | data        | <b>TurbStartIter</b>     | int        | Iteration number from which to solve the equation(s) selected turbulence model  |
| 35 | data        | <b>TurbExtModel</b>      | int        | Extended index of turbulence model <sup>1</sup>   |
| 36 | data        | <b>NumMonitorPoints</b>  | int        | Number of monitoring points   |
| 37 | data        | <b>Point-[n].X</b>       | float      | X coordinate of monitoring poin № [n] (m)   |
| 38 | data        | <b>Point-[n].Y</b>       | float      | Y coordinate of monitoring poin № [n] (m)   |

1 0 — turbulence model is not used (laminar)

1 — The integrated model (used to calculate the heat transfer with using criterial equations)

2 — [algebraic](#) RANS models (Zero equation models)

3 — RANS models with one equation ([Spalart-Allmaras](#) model, [Sekundov Nut-92](#) model)

4 — RANS models with two equations ([k-ε](#), [k-ω](#))

Table 1

| No | Object type | Object name                                | Value type | Description  |
|----|-------------|--|------------|--|
| 39 | data        | <b>InitTime</b>                            | float      | Initial time value (sec)   |
| 40 | data        | <b>Ts0</b>                                 | float      | The wall temperature, K  |
| 41 | data        | <b>K0</b>                                  | float      | Stoichiometric ratio (used in the combustion problems)   |
| 42 | data        | <b>gamma</b>                               | float      | Factor "completion" of a chemical reaction:<br>1.0 - no combustion<br>0.0 - complete combustion<br>(used in the combustion problems)   |
| 43 | data        | <b>Tf</b>                                  | float      | Ignition temperature, K<br>(used in the combustion problems)   |
| 44 | data        | <b>NumSrc</b>                              | int        | The number of gas sources ("Src" objects)  |
| 45 | data        | <b>Src</b> <sup>[n]</sup> <b>.GasSrcSX</b> | int        | <sup>[n]</sup> — index of the gas source.<br>The X coordinate (index of X coordinate in nodes) <u>starting point</u> of the segment along which introduces additional source terms |
| 46 | data        | <b>Src</b> <sup>[n]</sup> <b>.GasSrcSY</b> | int        | <sup>[n]</sup> — index of the gas source.<br>The Y coordinate (index of Y coordinate in nodes) <u>starting point</u> of the segment along which introduces additional source terms |
| 47 | data        | <b>Src</b> <sup>[n]</sup> <b>.GasSrcEX</b> | int        | <sup>[n]</sup> — index of the gas source.<br>The X coordinate (index of X coordinate in nodes) <u>end point</u> of the segment along which introduces additional source terms      |
| 48 | data        | <b>Src</b> <sup>[n]</sup> <b>.GasSrcEY</b> | int        | <sup>[n]</sup> — index of the gas source.<br>The Y coordinate (index of Y coordinate in nodes) <u>end point</u> of the segment along which introduces additional source terms      |

---

2     <sup>[n]</sup> — index of the object "Src", 1..n  
3     <sup>[n]</sup> — index of the object "Src", 1..n  
4     <sup>[n]</sup> — index of the object "Src", 1..n  
5     <sup>[n]</sup> — index of the object "Src", 1..n

Table 1

| No | Object type | Object name                          | Value type | Description  |
|----|-------------|--------------------------------------|------------|--|
| 49 | data        | <b>Src[n].GasSrcIndex</b>            | int        | [n] — index of the gas source.<br>GasSrcIndex — index component received through this source<br>0 - "fuel"<br>1- "oxidizer"<br>2 – "combustion products"<br>3 - "inert ingredient"<br>4 - mixture of 4 above mentioned components in predetermined proportions |
| 50 | data        | <b>Src[n].Msrc</b>                   | float      | Mass flow component source in Src[n], kg/sec   |
| 51 | data        | <b>Src[n].Tsrc</b>                   | float      | The temperature of the feed component source in Src[n], K  |
| 52 | data        | <b>Src[n].Tf_src</b>                 | float      | Ignition temperature in source Src[n], K   |
| 53 | data        | <b>Src[n].Y_cp</b>                   | float      | The relative concentration of combustion products in source Src[n] (feeding a mixture of components).  |
| 54 | data        | <b>Src[n].Y_air</b>                  | float      | The relative concentration of the inert component (e.g. air) in source Src[n] (feeding a mixture of components).   |
| 55 | data        | <b>Src[n].Y_fuel</b>                 | float      | The relative concentration of fuel in source Src[n] (feeding a mixture of components).   |
| 56 | data        | <b>Src[n].Y_ox</b>                   | float      | The relative concentration of the oxidizer in source Src[n] (feeding a mixture of components).   |
| 57 | data        | <b>NumFlow</b>                       | int        | The number of objects "Flow" (deprecated)  |
| 58 | data        | <b>Flow[n]<sup>6</sup>.CompIndex</b> | int        | CompIndex — index of the integral component:<br>0 - "fuel"<br>1- "oxidizer"<br>2 – "combustion products"<br>3 - "inert ingredient"   |
| 59 | data        | <b>Flow[n]<sup>7</sup>.p</b>         | float      | p — static pressure (Pa) associated with the object "Flow"   |

---

6 [n] — index of the object "Flow", 1..n

7 [n] — index of the object "Flow", 1..n

Table 1

| No | Object type | Object name                              | Value type | Description   |
|----|-------------|--|------------|---|
| 60 | data        | <b>Flow[n]<sup>8</sup>.Type</b>          | int        | Type - How to set the speed of the object "Flow":<br>0 - absolute value of speed<br>1 - relative critical velocity - $\lambda$  |
| 61 | data        | <b>Flow[n]<sup>9</sup>.W</b>             | float      | W – absolute value of velocity, m/sec <sup>ii</sup>   |
| 62 | data        | <b>Flow[n]<sup>10</sup>.Lam</b>          | float      | Lam – value of relative critical velocity   |

| 156 | data        | <b>p_ambient</b>          | float      | Reference ambient pressure for calculating velocity coefficient $C_v$ (for nozzle)   |
| 157 | data        | <b>NumXCut</b>            | int        | Number of probed cross-sections along the X axis   |
| 158 | data        | <b>CutX-[n].x0</b>        | float      | Coordinate X (m) of the start cross-section with the index [n]   |
| 159 | data        | <b>CutX-[n].y0</b>        | float      | Coordinate Y (m) of the start cross-section with the index [n]   |
| 160 | data        | <b>CutX-[n].dy</b>        | float      | Size of cross-section(m) along the Y axis with the index [n]   |
| 161 | data        | <b>isIgnoreUnsetNodes</b> | int        | 0 – do not ignore the uninitialized nodes (In the presence of uninitialized nodes task is interrupted)<br>1 – ignore the uninitialized nodes   |
| 162 | data        | <b>ThreadBlockSize</b>    | int        | Size of <i>CUDA</i> threads block ( <i>only for CUDA version</i> )<br>0 – calibrate size of threads block for maximum performance (recommended)<br>>0 – number of threads in threads block |
| 163 | data        | <b>isLocalTimeStep</b>    | int        | Use local time step<br>0 – No<br>1 – Yes   |

Table 2

| No | Variable name  | Variable description   | Units                    |
|----|----------------|--|--------------------------|
| 1  | <b>U</b>       | Gas velocity along X axis  | m/sec                    |
| 2  | <b>V</b>       | Gas velocity along Y axis (or radial velocity for axisymmetric case) | m/sec                    |
| 3  | <b>T</b>       | Static gas temperature   | K                        |
| 4  | <b>p</b>       | Static gas pressure  | Pa                       |
| 5  | <b>Rho</b>     | Gas density  | kg/m <sup>3</sup>        |
| 6  | <b>Y_fu</b>    | The relative concentration of fuel                                   | -                        |
| 7  | <b>Y_ox</b>    | The relative concentration of oxidizer                               | -                        |
| 8  | <b>Y_cp</b>    | The relative concentration of combustion products                    | -                        |
| 9  | <b>Y_air</b>   | The relative concentration of inert component                        | -                        |
| 10 | <b>Src_fu</b>  | Source term for fuel concentration equation                          | kg/(sec*m <sup>3</sup> ) |
| 11 | <b>Src_ox</b>  | Source term for oxidizer concentration equation                      | kg/(sec*m <sup>3</sup> ) |
| 12 | <b>Src_m</b>   | Source term for equation of continuity                               | kg/(sec*m <sup>3</sup> ) |
| 13 | <b>Src_E</b>   | Source term for equation of energy conservation                      | Wt/m <sup>3</sup>        |
| 14 | <b>Q_heat</b>  | Specific heat flux   | Wt/m <sup>2</sup>        |
| 15 | <b>mu_t/mu</b> |  | -                        |
| 16 | <b>Mach</b>    | Mach number  |                          |
| 17 | <b>T*</b>      | Total gas temperature  | K                        |
| 18 | <b>p*</b>      | Total gas pressure   | Pa                       |

0 — algebraic model of Prandtl (the mixing length model)

1 — Van Driest algebraic model

2 — Eskudier algebraic model

3 — Klebanoff algebraic model

4 — Standard  $k-\epsilon$  Spalding model

5 — Chien  $k-\epsilon$  model

6 — Jones-Launder  $k-\epsilon$  model

7 — Launder-Sharma  $k-\epsilon$  model with Yapp correction

8 — RNG  $k-\epsilon$  model

9 — Spalart-Allmaras model

ii For object “Flow” velocity component along the axis X (or axial) equals the value of W, and a velocity component along the axis Y (or radial) equals 0

iii [n] — The index of an object “SingleBound”

iv [n] — The index of an object “SingleBound”

v BC may have the following values:

Base BC:

CT\_NO\_COND\_2D - BC not defined

CT\_Ro\_CONST\_2D -  $\rho = \text{const}$

CT\_U\_CONST\_2D -  $\rho U = \text{const}$

CT\_V\_CONST\_2D -  $\rho V = \text{const}$

CT\_T\_CONST\_2D -  $\rho E = \text{const}$

CT\_Y\_CONST\_2D -  $\rho Y = \text{const}$

CT\_dRdx\_NULL\_2D -  $d\rho/dx = 0$

CT\_dUdx\_NULL\_2D -  $d\rho U/dx = 0$

CT\_dVdx\_NULL\_2D -  $d\rho V/dx = 0$

CT\_dTdx\_NULL\_2D -  $d\rho E/dx = 0$

CT\_dYdx\_NULL\_2D -  $d\rho Y/dx = 0$

CT\_dRdy\_NULL\_2D -  $d\rho/dy = 0$

CT\_dUdy\_NULL\_2D -  $d\rho U/dy = 0$

CT\_dVdy\_NULL\_2D -  $d\rho V/dy = 0$

CT\_dTdy\_NULL\_2D -  $d\rho E/dy = 0$

CT\_dYdy\_NULL\_2D -  $d\rho Y/dy = 0$

CT\_d2Rdx2\_NULL\_2D -  $d^2\rho/dx^2 = 0$

CT\_d2Udx2\_NULL\_2D -  $d^2\rho U/dx^2 = 0$

CT\_d2Vdx2\_NULL\_2D -  $d^2\rho V/dx^2 = 0$

CT\_d2Tdx2\_NULL\_2D -  $d^2\rho E/dx^2 = 0$

CT\_d2Ydx2\_NULL\_2D -  $d^2\rho Y/dx^2 = 0$

CT\_d2Rdy2\_NULL\_2D -  $d^2\rho/dy^2 = 0$

CT\_d2Udy2\_NULL\_2D -  $d^2\rho U/dy^2 = 0$

CT\_d2Vdy2\_NULL\_2D -  $d^2\rho V/dy^2 = 0$

CT\_d2Tdy2\_NULL\_2D -  $d^2\rho E/dy^2 = 0$

CT\_d2Ydy2\_NULL\_2D -  $d^2\rho Y/dy^2 = 0$

CT\_WALL\_NO\_SLIP\_2D — BC «no-slip wall»

CT\_WALL\_LAW\_2D — BC «wall law»

Special BC:

CT\_NONREFLECTED\_2D - non-reflected BC

---
